BREAST HEALTH AWARENESS APP

It is an app that helps women keep track of breast changes, remember when they noticed them, understand when to seek medical advice, and communicate their observations clearly to a doctor.

A privacy-first Breast Self-Awareness Tracker that guides users through a structured self-awareness routine, tracks hand movement across predefined body zones using optional on-device camera processing, records unusual findings, maintains a monthly history, and generates a consultation-ready PDF.

CORE FEATURES:

1. Guided self-awareness routine

Step-by-step instructions with visual guidance and voice prompts for the breast, underarm, and collarbone regions.

2. Optional camera-based coverage tracking

MediaPipe estimates body and hand landmarks to approximate which predefined zones the user's hand passes through. The avatar highlights estimated coverage and prompts users to revisit potentially missed zones. A manual mode is always available.

3. Findings log and monthly history

Users record the date, location, type of change, optional notes, and cycle timing. A timeline helps them review previous observations without interpreting them as a diagnosis.

4. Clinician-ready report

Generates a one-page PDF containing recorded findings, dates, locations, history, and personal notes for discussion with a healthcare professional.

Technology	**Purpose**	**Owner**
React + TypeScript + Vite	User interface and application logic	Person 2
MediaPipe Pose Landmarker	Estimates body landmarks for torso alignment	Person 1
MediaPipe Hand Landmarker	Estimates hand and fingertip positions	Person 1

SVG	Displays the abstract avatar and interactive body zones	Persons 1 + 2
IndexedDB	Stores observations and monthly history locally	Person 3
Web Speech API	Provides spoken guidance where supported	Person 2
jsPDF	Generates the consultation summary	Person 3
CSS / Tailwind CSS	Styles the interface and makes it responsive	Person 2
